management

Operating in the cloud

Many businesses wish to use the cloud to provide their IT platforms and services. Cloud enablement is a common goal for businesses, due to benefits such as pay as you go pricing, low startup costs, flexibility, faster development cycles and ease of management. As with all services used by your business you need to consider the security impact of cloud usage. Typical concerns are:

- inadequate security controls
- weak governance
- unclear cloud strategy
- lack of cloud architecture experience
- supply chain concerns
- loss of data through theft or accidental breach.

Migrating to the cloud often involves complex planning to prevent impacts to your current operations. Operating securely within the cloud (or across multiple clouds) is no different. In this brochure we introduce CSP cloud services that can help you secure your business critical platforms and services.

Strategy and architecture

Strategy and architecture review Services offered

Operating your services within the cloud will be part of your wider business and IT strategy.

Given the speed of development cloud services need regular reviews to stay current with cloud platform architecture practices and to remain optimised for best performance.

A lack of cyber security expertise or of a well-managed security strategy can lead to escalating costs, inefficiencies and security vulnerabilities.

Our experienced consultants can help:

- develop a cloud security strategy
- review your existing cloud strategy to strengthen cyber security
- supply cloud security architecture expertise
- integrate your infrastructure securely
- develop a cost-effective migration strategy.

We are an independent and objective consultancy that can bridge those gaps and protect your business assets.

Security controls review

Over time, cloud platforms and services evolve with the release of new tools and products. This is especially true of cyber security services.

Cloud services are just as vulnerable as traditional networks. Configuration management, patching, vulnerability management, resilience and service management all need to be considered.

We recommend a regular review of all security tools in use to make the most of their features so you can maximise the benefit of your investment.

Services offered

CSP offer security control reviews that cover:

- identity and access management
- applications
- networks and perimeter controls
- operating systems
- infrastructure
- log management audits
- development and deployment processes.

Governance controls

Governance review

Cloud platforms and services are a core part of any business and must be managed in line with business operations.

Governance controls require review when factoring in changes to:

- a) regulatory requirements
- b) threat and risk management.

Additionally, the on-going management and auditing of services in the cloud must provide assurance to senior business stakeholders and shareholders.

Services offered

We will help you:

- assess implications of business change on your cloud services
- establish cloud governance processes
- review regulatory control effectiveness
- conduct cloud risk assessments.

We also provide independent audit and assurance reports for your stakeholders and management team.

Supply chain review

Current trends show that the cloud supply chain is under ever-increasing pressures from external attacks.

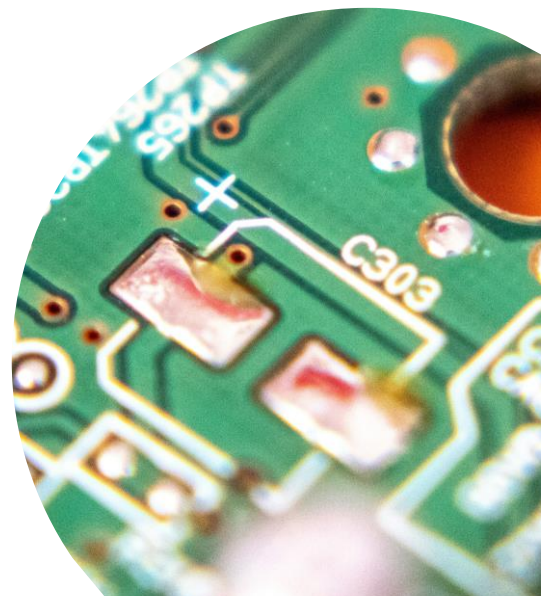

Every major cloud platform uses different software components that belong to other companies, or may even be open source.

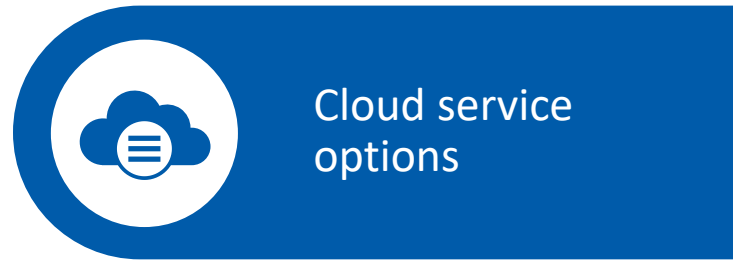

There is a risk that third-party components contain weaknesses and vulnerabilities that could impact your cloud service and business operations.

Services offered

CSP consultants can help you:

- map your supply chain
- identify suppliers that need a closer inspection
- help you assess your high priority suppliers
- provide independent assurance reports on your suppliers.

Cloud service options

Our cloud security approach focuses on your business and operations. Our services are tailored to meet your requirements wherever you are on your cloud enablement journey.
